The display screen (5) is positioned in the view of the driver eg. on the steering wheel. The functions are selected by moving a cursor (5a) onto the appropriate icon using a cursor wheel (6). This brings into view a menu or a different set of symbols. The function can be released by pressing the cursor wheel. The cursor wheel can be fitted into the end of a control stalk. A joystick (7) on the steering wheel can adjust the values etc. of the selected function. An identical display, connected to the main display, can be positioned in the reach of the front seat passenger. This slave display is fitted with cursor wheels and can select the same functions.
